

ABSTRACT OF THE DISCLOSURE

To provide a liquid composition in which changes in physical properties with time are reduced or prevented, and a film-forming apparatus capable of forming a film pattern of the liquid composition with a high productivity a film-forming apparatus includes a liquid composition preparing unit to prepare a liquid composition containing an organic functional material, a solvent, and a metal deactivator; and a liquid discharge apparatus to discharge a liquid containing the liquid composition prepared in the liquid composition preparing unit onto a substrate. Since the liquid composition contains the metal deactivator, changes or degradation in the physical properties with time of the organic functional material can be reduced or prevented.
